Ansible Use Cases for Home Lab Automation

It appears your VirtualBox still has duplicate disk references - both old (C:) and new (E:) locations for some disks. Here's how to clean this up properly:

Step-by-Step Cleanup

1. First, Remove Orphaned C: Disk References

```powershell
# Close VirtualBox completely first
cd "C:\Program Files\Oracle\VirtualBox"

# Remove the old C: disk registration (only keeping E: version)
.\VBoxManage.exe closemedium disk "1bdb7a57-6533-4dbc-a5ba-5195ad065f5b" --delete
```

2. Verify VM Disk Attachments

For each VM (kmaster, kworker1, kworker2):

```powershell
.\VBoxManage.exe showvminfo "kmaster" | findstr "Storage"
.\VBoxManage.exe showvminfo "kworker1" | findstr "Storage"
```
